## SUMMARY

Growers generally use herbicides to efficiently produce high-quality fruit and vegetables for processing or fresh market sales. Because of the smaller acreage of these crops compared with major field crops, fewer herbicides are registered for use in fruit and vegetable crops than for field crops. Each year, new herbicides are evaluated under Arkansas growing conditions with the objective of improving the herbicide technology for the grower, processor, and ultimately the consumer. This report includes studies on the control of many of the more serious weed problems in important crops of this region, including snapbeans, spinach and other greens, southernpeas, tomatoes, and grapes.

## TABLE OF CONTENTS

Introduction .....	1
Methods and Results .....	2
Herbicide Evaluation in Snapbeans, Lowell.....	2
Evaluation of Herbicides in Arkansas greens, Kibler .....	3
Evaluation of Herbicides in Over-wintered Spinach, Kibler .....	3
Evaluation of Herbicides in Southernpeas, Fayetteville.....	4
Evaluation of Herbicides in Grapes, Fayetteville .....	5
Evaluation of Herbicides in Tomatoes, Fayetteville .....	5
Tables	
1. Weed control and plant injury associated with various herbicides in snapbeans .....	6
2a. Weed control associated with various herbicides in Arkansas greens .....	8
2b. Plant injury and yield associated with various herbicides in Arkansas greens .....	9
3a. Weed control associated with various herbicides in over-wintered spinach .....	10
3b. Weed control, plant injury, and yield associated with various herbicides in over-wintered spinach .....	11
4a. Weed control associated with various herbicides in southernpeas .....	12
4b. Weed control, plant injury, and yield associated with various herbicides in southernpeas .....	13
5a. Weed control associated with various herbicides in grapes .....	14
5b. Weed control, sucker control, plant injury, and yield associated with various herbicides in grapes .....	15
6. Weed control, plant injury, and yield associated with various herbicides in tomatoes .....	16
Appendix Tables .....	17
1. Common, trade, and chemical names of herbicides used.....	17
2. Climatological data, Main Experiment Station, Fayetteville .....	19
3. Climatological data, Vegetable Substation, Kibler .....	20
4. Standardized plant (Bayer) codes, Weed Science Society of America, for weeds appearing in this report .....	21
Conversion Table .....	22

## ACKNOWLEDGMENTS

This research was made possible in part by financial support through the IR-4 Project (Center for Minor Crop Pest Management, National Agricultural Programs to Clear Pest Control Agents for Minor Uses) in the Southern region and Allen Canning Company. The following companies supplied herbicides used in these experiments: AgrEvo, American Cyanamid, BASF, Bayer, Dow AgroSciences, DuPont, FMC, Gowen, Monsanto, Novartis, Platte Chemical, Valent, and Zeneca. Seed was supplied by Dr. Ted Morelock and Alma Farm Supply. The financial and technical support received from these companies is also appreciated. Appreciation for assistance in these studies is extended to Dennis Motes, Resident Director; Steve Eaton and Larry Martin, Research Assistants; and the technicians of the Vegetable Substation, Kibler; as well as Steve Brown and William Russell of Allen Canning Company.
