ACKNOWLEDGMENTS

This research was funded in part by participating companies.
The assistance of the following individuals in conducting these experiments is gratefully acknowledged:

Department of Plant Pathology, University of Arkansas, Fayetteville

Dr. Rick Cartwright, Professor and Interim Head

Dr. David TeBeest, University Professor

Northeast Research and Extension Center, Keiser

Dr. F.M. Bourland, Center Director

Mr. Mike Duren, Program Technician II

The Lon Mann Cotton Research Station, Marianna

Mr. Claude Kennedy, Resident Director

Mr. Bill Apple, Program Technician I

Southeast Research and Extension Center, Monticello

Dr. Kelly Bryant, Center Director

Mr. Larry Earnest, Superintendent, Rohwer Division

Mr. Randy Cingolani, Program Technician III, Rohwer Division

Rice Research and Extension Center, Stuttgart

Dr. Christopher Deren, Center Director

Mr. Jonathan McCoy, Program Technician I

Southwest Research and Extension Center, Hope

Dr. Vic Ford, Center Director

Mr. J.D. Barham, Program Technician III

Mr. Joe Vestal, Staff Chair, Lafayette County Extension Office

Dr. Terry Kirkpatrick, Professor

ARKANSAS CORN AND GRAIN SORGHUM PERFORMANCE TESTS¹ 2008

D.G. Dombek,² R.D. Bond,³ I.L. Eldridge,⁴ and R.M. Pryor⁵

INTRODUCTION

Corn and grain sorghum performance tests are conducted each year in Arkansas by the University of Arkansas Division of Agriculture. The tests provide information to companies marketing seed within the state and aid the Arkansas Cooperative Extension Service in formulating recommendations for producers.

The 2008 corn performance tests contained 96 entries and were conducted at the Northeast Research and Extension Center (NEREC) at Keiser, the Lon Mann Cotton Research Station (LMCRS) near Marianna, the Bell Farming Company near Des Arc, the Southeast Research and Extension Center - Rohwer Division (SEREC-RD) near Rohwer, the Rice Research and Extension Center (RREC) near Stuttgart, and the Gary Burton Farm, LaFayette County, Arkansas. The 2008 grain sorghum performance tests contained 30 entries and were conducted at the NEREC, the LMCRS, the SEREC-RD, and the RREC. Test location maps for grain sorghum and corn can be found inside the back cover.

MATERIALS AND METHODS

Corn hybrids were divided into two maturity groups. Based on information provided by the originating companies, entries were placed into a 116 or fewer days-to-maturity group (Early- to Mid-Season) or 117+ group (Mid- to Full-Season).

Within each test, entries were arranged as a randomized complete block design with four replications. Plots were two rows wide and 20-25 feet long depending on location. Seeding rates for each corn and grain sorghum hybrid were based on the recommendations of the originating company.

All plots were harvested with a plot combine. Specific location and management practice information accompany each table.

GRAIN SORGHUM PERFORMANCE MEASUREMENTS

Yield: Yields were calculated from the weight of threshed grain from each plot and are expressed as pounds per acre (lbs./A) at 14% moisture.

Grain Moisture: Expressed as a percent moisture of grain at harvest.

Plant Height: Average height in inches from the soil surface to the top of the grain head.

Head Exertion: Average distance in inches from the flag leaf to base of panicle.

Head Compactness Scale:

1 = Head short and oval. Rachis branches intermediate in length.

2 = Head long and slender. Rachis branches strong and short.

3 = Head elongated and oval. Rachis branches beginning to weaken and intermediate in length.

4 = Head elongated and rectangular in shape. Rachis branches intermediate in strength and length.

5 = Head open and elongated. Rachis branches weak.

Bird Damage: A visual estimate of total percent grain loss from each plot.

¹Use of products and trade names in this report does not constitute a guarantee or warranty of the products named and does not signify that those products are approved to the exclusion of comparable products.

²Program Director, Arkansas Agricultural Experiment Station, University of Arkansas, Fayetteville, Ark. 72701.

³Program Technician, Department of Crop, Soil & Environmental Sciences, University of Arkansas, Fayetteville, Ark. 72701.

⁴Program Associate, Department of Crop, Soil & Environmental Sciences, University of Arkansas, Fayetteville, Ark. 72701.

⁵Program Assistant, Department of Crop, Soil & Environmental Sciences, University of Arkansas, Fayetteville, Ark. 72701.

CORN PERFORMANCE MEASUREMENTS

Yield: Yields were calculated from the weight of shelled corn harvested from each plot and are expressed as bushels per acre (bu./A) at 15.5% moisture.

Grain Moisture: Expressed as a percent moisture of shelled grain at harvest.

Root Lodging: Average number of plants leaning more than 40 degrees from vertical at harvest.

Stalk Lodging: Average number of plants broken below an ear at harvest.

Plants/Acre: The plant population count, expressed in the number of plants per acre.

Ear Height: The average distance in inches from the soil surface to the point of attachment of upper ear.

Test Weight: Test weights, expressed in pounds per bushel (lbs./bu), were determined using subsamples from plots.

Tip Cover: Tip cover was rated as good (1), average (2), or poor (3). A rating of good was given when the husks reached well beyond the end of the ear and fitted tightly. A rating of average was given when the husks reached the tip of the ear or fitted loosely. A rating of poor was given when the ears were open to the weather.

² A test was also planted at the Rice Research and Extension near Stuttgart.
 A May 10 tornado passed within approximately 300 yards of the test causing
 extensive damage to plants and the test was subsequently abandoned.

³ A test was also planted at the Lon Mann Cotton Research station near Marianna.
 Harvest was begun on August 28 but a breakdown immediately followed by repeated rainfall
 delayed the completion of harvest until September 8. The plots harvested on September 8 yielded
 less than those on August 28 and the test results were discarded.

⁴ Planting was delayed due to prolonged wet weather.

¹Keiser Irrigated. = Northeast Research and Extension Center
 Marianna Irrigated. = Lon Mann Cotton Research Station
 Stuttgart Irrigated. = Rice Research and Extension Center
 Rohwer Irrigated. = Southeast Research and Extension Center - Rohwer Division

²Off-station tests were also planted in producers fields near Des Arc and Gin City.
 The tests at Des Arc were accidentally sprayed with glyphosate and were abandoned.
 The tests at Gin City were lost due to lodging from high winds from the remnants of Hurricane Ike on September 13.

³ Planting of tests at this location was delayed until May 19 because of prolonged wet weather.
 High winds from the remnants of Hurricane Ike on September 14 caused significant lodging for some hybrids.

⁴ The tests at this location had significant lodging due to a tornado that passed within approximately 300 yards of the tests on May 10. Additional lodging resulted from 50 mph winds on July 4.
