IMPACT STATEMENT

Good Forestry is a step-by-step summary of proven management practices for loblolly pine stands. The two tables presented (one for natural stands and the other for plantations) bring together three key management components: growth information, a schedule of recommended operations, and the costs and returns of each. The knowledge distilled in these tables will allow foresters and land owners to increase annual returns to \$45–47 per acre on a sustainable basis.

KEY WORDS

Forest management, ice damage,
loblolly pine, thinning.

CONTENTS

Introduction	1
Management Objectives.....	2
Conserving the Environment	2
Increasing Merchantable Yield	2
Reducing Ice Damage	2
Abbreviations and Definitions Used in the Tables	3
Assumptions Used in Developing the Tables.....	4
Annual Mortality of Naturally Regenerated Stands	4
Annual Mortality of Trees in Planted Stands	4
Costs	4
Site Preparation for Plantations	5
Returns	5
Management Notes for Natural Stands.....	6
Sapling Stage.....	6
Pulpwood Stage.....	7
Sawtimber Stage	8
